Separate cDNAs were generated using primers that incorporated unique 5 and 3 tags to distinguish each source of RNA. cDNAs were then pooled, size-fractionated, directionally cloned into a custom medium-copy vector and transformations made with four size classes to minimize size bias. Details of each source of RNA and library size bias. Details of each source of RNA and library
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /clone_lib="QG_EFGHJ lettuce serriola"

                                                                                                                                                                                                                                                                        Address for correspondence: kaos@kazusa.or.jp
For the latest information on annotation of this clone, please see
http://www.kazusa.or.jp/kaos/cgi-bin/agd_graph.cgi?c=MVAll
Genes with similarity to proteins in the databases are described in
'product' or 'note' qualifiers. Genes that have no significant
protein similarity are described as 'unknown protein'.
The software programs used to predict genes include: Grail
(Informatics Group, Oak Ridge National Laboratory,
http://compbio.ornl.gov/Grail-1.3/)
GENSCAN (Chris Burge, MIT, http://CCR-081.mit.edu/GENSCAN.html),
NetGene2 (S.M. Hebsgaard, et al., CBS, Technical University of
Denmark, http://www.cbs.dtu.dk/services/NetGene2/) and
SplicePredictor (Volker Brendel, Stanford University,
http://gremlinl.zool.iastate.edu/ggi-bin/sp.ggi).
Genes encoding tRNAs are predicted by tRNAscan-SE
(Sean Eddy, Washington University School of Medicine, St. Louis,
http://genome.wustl.edu/eddy/tRNAscan-SE).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1478

Protein homologies of the coding regions were searched against NCBI NonRedundant Protein database with BLASTP2.0. ESTs represent the identified cDNA sequences using BLASTN 2.0 with the corresponding DDBJ accession no. and RGP clone ID. A gene with identity or significant homology to a protein is classified based on the protein name to indicate the homology level such as same name, 'putative-' and '-like protein'. A gene without significant homology to any protein but with EST homology (covering almost the entire length of partial sequence) is classified as an 'unknown' protein. A gene predicted with a gene prediction program is classified as a 'hypothetical' protein.

The orientation of the sequence is from T7 to SP6 of the PAC clone. This sequence of P0436D06 clone has an overlap with P0507H06 (DDBJ.AP003144) clone at 5' end. Detailed information on overlap and assembly quality together with annotation of this entry is available at http://rgp.dna.affrc.go.jp/GenomeSeq.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 GENSCAN1.0, BLASTN2.0, BLASTX2.0 as well as SplicePredictor (October 1998 version). The genomic sequence was searched against NCBI NonRedundant Protein database, nr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CWFMVYKVGMGNAGAALSVSICDWVEVTVLGLYIVLSPSCEKTRAPLTWEAFSGIGSF

NOTE: It currently consists of 1 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submitter. This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      'product' or 'note' qualifiers. Genes that have no significant protein similarity are described as 'unknown protein'.

The software programs used to predict genes include: Grail (Informatics Group, Oak Ridge National Laboratory, http://compbio.ornl.gov/Grail-1.3/),
GENSCAN (Chris Burge, MIT, http://CCR-081.mit.edu/GENSCAN.html),
NetGene2 (S.M. Hebsgaard, et al., CBS, Technical University of Denmark, http://www.cbs.dtu.dk/services/NetGene2/) and SplicePredictor (Volker Brendel, Stanford University, http://gremlinl.zool.iastate.edu/cgi-bin/sp.cgi).
Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, Washington University School of Medicine, St. Louis, http://genome.wustl.edu/eddy/tRNAscan-SE/).
This sequence may not be the entire insert of this clone. It may be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Address for correspondence: kaos@kazusa.or.jp

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                               Score

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              binding site (version 2). The invention provides molecular tools in the form of retroelements and retroelement-containing vectors, cells and plants. Methods are provided for introducing the retroelements into cells, especially when the retroelement carries at least 1 agronomically-significant characteristic. In a preferred method, a helper cell line which expresses gag, pol and env sequences is used to enable transfer of a secondary construct which carries an agronomically-significant characteristic and has retroelement sequences that allow for replication and integration. Claimed isolated nucleic acid molecules comprise a nucleic acid sequence selected from a retroelement primer binding site, envelope, gag, integrase, reverse transcriptase, protease or retroviral particles that are used to transfer the nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

  This is the nucleotide sequence of the Calypso 1-1 retroelement of soybean. It was identified by screening of a soybean lambda library using a reverse transcriptase probe. 2 Groups of soybean retroelements were identified, i.e. Calypso 1-1, 1-2 and 1-3 (see AAZ35271-73) and Calypso 2-1 and 2-2 (see AAZ35274-75).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cc retroelements include gag, pol, env and primer binding site cc sequences that can be used in constructs of the invention. The c invention provides molecular tools in the form of retroelements and cretroelement-containing vectors, cells and plants. Methods are provided for introducing the retroelements into cells, especially when the retroelement carries at least 1 agronomically-significant characteristic (ACS). In a preferred method, a helper cell line c which expresses gag, pol and env sequences is used to enable transfer of a secondary construct which carries an ASC and has c retroelement sequences that allow for replication and integration. C claimed isolated nucleic acid molecules comprise a nucleic acid c sequence selected from a retroelement primer binding site, envelope, integrase, reverse transcriptase, protease or MASe-H sequence (see AAZ35254-61). Also provided are plant retroviral particles that c particles are used to transfer the nucleic acids into plant cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match
                       This is the nucleotide sequence of the Calypso 2-2 retroelement of soybean. It was identified by screening of a soybean lambda library using a reverse transcriptase probe. 2 Groups of soybean retroelements were identified, i.e. Calypso 1-1, 1-2 and 1-3 (see AA35271-73) and Calypso 2-1 and 2-2 (see AA35274-75). The retroelements include gag, pol, env and primer binding site sequences that can be used in constructs of the invention. The invention provides molecular tools in the form of retroelements and invention provides molecular tools in the form of retroelements.

                                                                                                                                                                                                                                                                                       This invention relates to a method for identifying a nucleotide or polypeptide sequence that may be a drug target, or essential for growth or viability of an organism. Polynucleotide sequences AAH51947 - AAH52092 represent DNA encoding proteins AAG81096 - AAG81241, Mycobacterium tuberculosis proteins which are potential drug targets. The DNA and protein sequences are used to illustrate the method of the invention. The method involves providing an unknown nucleotide or polypeptide sequences, and comparing it to a number of sequences along with at least one algorithm capable of analysing a functional relationship between nucleotide and polypeptide sequences. The method is useful for characterising the function of nucleic acids and polypeptides that may be useful as a target for a drug or essential for the growth or viability of an organism.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                nucleotide sequence of the first strain at positions in the complete sequence of the genome that correspond to positions that differ in the nucleotide sequences of M. tuberculosis strains CDC 1551 (AAI99683) and H37RV (AAI99682). The method is useful for evaluating strain variation M. tuberculosis and has valuable application in the fields of tuberculosis genetics, epidemiology, patient treatment and epidemic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to evaluating strain variation within and between different populations of the tuberculosis bacterial pathogen, Mycobacterium tuberculosis or related Mycobacterium by determining the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Evaluating strain variation of Mycobacterium tuberculosis, comprises determining the nucleotide sequence of the strain at positions in the genome corresponding to positions where M. tuberculosis strains CDC 1551 and H37Rv differ
                                                                                                                                                                                                                                                                                                                                                                            Mycobacterium

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to evaluating strain variation within and between different populations of the tuberculosis bacterial pathogen, Mycobacterium tuberculosis or related Mycobacterium by determining the nucleotide sequence of the first strain at positions in the complete sequence of the genome that correspond to positions that differ in the nucleotide sequences of M. tuberculosis strains CDC 1551 (AA199683) and H37RV (AA199683). The method is useful for evaluating strain variation of M. tuberculosis and has valuable application in the fields of tuberculosis genetics, epidemiology, patient treatment and epidemic
                                                                The invention relates to evaluating strain variation within and between different populations of the tuberculosis bacterial pathogen, Mycobacterium tuberculosis or mycobacterium by determining the nucleotide sequence of the first strain at positions in the complete sequence of the genome that correspond to positions that differ in the nucleotide sequences of M. tuberculosis strains CDC 1551 (AAI99683) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 4403765

                                                                                        Query Match
                                                                                                                                                                                                             The invention relates to evaluating strain variation within and between different populations of the tuberculosis bacterial pathogen, Mycobacterium tuberculosis or related Mycobacterium by determining the nucleotide sequence of the first strain at positions in the complete sequence of the genome that correspond to positions that differ in the nucleotide sequences of M. tuberculosis strains CDC 1551 (AA199683) and H37Rv (AA199683). The method is useful for evaluating strain variation c M. tuberculosis and has valuable application in the fields of tuberculosis genetics, epidemiology, patient treatment and epidemic
                                                                                                                                                 Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at seqdata.uspto.gov/sequence.html?DocID=6294328B1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            specification, but was obtained in electronic format directly from USPTO at seqdata.uspto.gov/sequence.html?DocID-6294328B1.

The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used: (1) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory and contains a strointestinal and respiratory contains a strointestinal and respiratory and contains and con
                                                                                                                                                                                                                                                                                                                                                                                                                                                    systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. ABQ13410-ABQ54121 represent genomic DNA sequences used to illustrate the method for determining the degree of cytosine methylation described in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; cytosine methylation; 5'-CpG-3'; uracil; cytosine; drug; side effect; cancer; central nervous system; cardiov gastrointestinal; respiratory system; single nucleotide pc SNP; cell differentiation; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Determining the degree of cytosine methylation in for diagnosis and prognosis, comprises selective hamplicons from chemically treated DNA -

                                                                                                                  Ş
                                                                                                                                                                                                                                 This invention describes a novel method for determining the degree of comethylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one commended and the degree of hybridisetion to both classes is determined from the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used: (1) for diagnosis and/or prognosis of side effects of the central nervous, cardiovascular, gastrointestinal and respiratory cystems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation. The method allows the methylation status of many C residues to be determined simultaneously. ABD13410-ABD54121 represent genomic DNA sequences used to illustrate the method for determining the degree of cytosine methylation described in the disclosure of the invention.
                                                                                                                                                               Query Match

The present invention describes a method for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of the same genes in one or more second filamentous fungal cells. The method uses fluorescence-labeled nucleic acids isolated from the FF cells and a substrate of expressed sequence tags (EST). The ESTS care used in the methods for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of the case genes in one or more second filamentous fungal cells. Monitoring the global expression of genes from FF cells allows the production optential of the microorganisms to be improved. New genes may be cell discovered, possible functions of unknown open reading frames can be compined and gene copy number variation and stability can be constituted and gene copy number variation and stability can be reproved to changes in culture conditions, environmental stress, spore adapt to changes in culture conditions, environmental stress, spore the continuous files of the second continuous conti
                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                         engineering. Using ESTs provides several advantages over genomic or random cDNA clones including elimination of redundancy as one spot on an array equals one gene or open reading frame, and organisation of the microarrays based on function of the gene products to facilitate analysis of the results. AAF07478 to AAF1147 represents ESTs from Aspergillus Fusarium venenatum; AAF11248 to AAF11853 represents ESTs from Aspergillus oryzae; and AAF11874 to AAF11878 represents ESTs from Aspergillus oryzae; and AAF1879 to AAF15337 represents ESTs from Trichoderma reesei, which are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 86; Page 737; 3161pp; English.

CC The invention discloses an isolated 25206 polypeptide, a human CC short-chain dehydrogenase/reductase (SDR) family member. Members of this CC family catalyse the reversible, rate limiting conversion of retinol to CC retinal. Retinal is then converted to retinolc acid which plays a key CC role in the regulation of embryoric development, spermatogenesis and CC epithelial differentiation. Short chain dehydrogenases are important in CC the metabolism of small molecules, production/removal of biologically CC important molecules that modulate development and growth, elimination of CC conditions. The polynuclectide and polypeptide are useful for identifying CC compounds which binds to them, for identifying compounds which binds to them, for identifying compounds which binds to them, for identifying compounds which modulate CC the activity of the polypeptide in a sample, for modulating aberrant activity of the polypeptide in a sample, for modulating aberrant activity of £ 25206 expressing cells (e.g. a cancerous, pre-cancerous or neural CC call) and for treating or preventing disorders characterised by the aberrant activity. The 25206 molecules can act as diagnostic targets and CC therapeutic agents for controlling one or more cellular proliferative, CC cancer, tumours, carcinoma, sarcoma and Hodgkin's disease, parkinsonism CC cancer, tumours, carcinoma, sarcoma and Hodgkin's disease, Parkinsonism CC cancer, carcinoma, sarcoma and Hodgkin's disease, Parkinsonism CC cancer, carcinoma, sarcoma and modulation disease, Parkinsonism CC cancer set the disorders (e.g. cancer set the disorders (e.g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel isolated 25206 polypeptide, a human short-chain dehydrogenase/reductase family member, useful as diagnostic targets and therapeutic agents for treating cancer, Alzheimer's disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; gene; ss; cytostatic; nootropic; neuroprotective; antitumour; 25206; short-chain dehydrogenase; short-chain reductase; SDR; retinol; retinal; retinolacid; embryonic development; spermatogenesis; epithelial differentiation; metabolism; development; growth; proliferative disorder; hammatopoletic disorder; cancer; tumour; afforderitive disorder; hammatopoletic disorder; cancer; tumour;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /industry vector: pBeloBACII; Site_1: HindIII; Site_2:
    HindIII; Rice is one of two most popular grains in the
    world. Half of the world population especially those
    inhabiting highly populated areas of the humid tropics
    and subtropics, rely on rice as their primary source of
    carbohydrate. Monocotyledonous rice is a diploid plant
    (2n=24) with a haploid genome equivalent of 431 Mbp
    (Arumuganathan and Earle, 1991). The relatively small
    genome of rice, three times larger than that of
    Arabidopsis, makes it suitable for genomic studies. In
    order to facilitate positional cloning, physical mapping
    and genome sequencing of rice, we have constructed a BAC
    library from Oryza sativa, Nipponbare variety. The
    library contains 36,864 clones with an average insert size
    of 128.5 Kb providing 10.9 haploid genome equivalents. The
    deep coverage allows the isolation a particular sequence
    with a probability of 99.9 % Two high density filters,
    each containing 18,432 clones (doubly spotted), represent
    the whole library for colony screening."
                                                                                                                                                  sheared ends.

Appl. Genet. 96:196, 1998) was constructed using the Eco RI site of pECSBAC4. The library consists of 72. 960 clones with an average insert size of 120 Kb, equal to 7 haploid genome equivalents. Screening of the library is done by hybridization of high-density colony filters and/or PCR amplification of DNA pools. Four high density filters, each containing 18,432 clones (doubly spotted), represent the whole library for colony screening" as 97 c 82 g 333 t 29 others
